

Plug-in Link for Petrel Data Import and Export

A new **Petrel** link to **Pre-Stack Pro** is available as an Ocean plug-in for commercial use from January 2016. The new link allows transfer of data between your **Petrel** and **Pre-Stack Pro** projects.

With the plug-in, users can easily populate new Pre-Stack Pro projects with data commonly available in Petrel, such as wells, logs, and horizons. Any new PPro-generated information such as stacks, attribute volumes or map objects, can just as easily be transported back to Petrel. No more tedious ASCII import and export. In addition, you can use the link to transfer selected gathers into Petrel, bypassing the Petrel pre-stack SEG-Y loader.

Transferable Data Types:

- **Well and well-related data:** trajectories, log-curves, tops, checkshots, T/D curves
- **Stacked seismic cubes, attribute volumes, and pre-stack gathers**
- **Horizons** and associated attribute maps
- **Map polygons** and seed points

A free test version of the plug-in is available for use until January 2016 and can be downloaded from our support portal pspro.plan.io. From January 2016, the plug-in will check for the plug-in license, which can be added to your company's existing Optimum license key.

Cost: 7.000 EUR per license + 20% annual maintenance fee.

(Foundation Project III customers will receive two free licenses)
